

Product Requirements Document

A unified digital platform for planning, managing, and optimizing the home-moving journey

Product	NAQL نَقْل
Document	Product Requirements Document (PRD)
Version	1.0
Product Stage	MVP Definition

From planning the move to choosing the right service provider, NAQL brings the entire journey into one clear experience.

1. Executive Summary

NAQL is a Saudi-focused digital platform that helps individuals and families plan, organize, and manage the process of moving from one home to another. The platform consolidates the most important moving activities tasks, packing, expenses, service discovery, and decision-making into one structured journey.

The product is designed around a simple principle: moving should not require users to coordinate information across notes, messages, spreadsheets, and multiple service providers. NAQL gives users a clear view of what needs to happen, what has been completed, what is coming next, and which service options best fit their budget and quality expectations.

Artificial intelligence is used as a decision-support capability within the product. The NAQL Smart Advisor analyzes available service-provider information and user priorities to recommend the most suitable options for furniture moving, cleaning, packing, storage, and related services.

2. Product Vision

To become the trusted digital companion for residential relocation in Saudi Arabia by making the moving journey simpler, more transparent, and easier to manage from start to finish.

3. Problem Statement

Residential moving is operationally fragmented. Users are required to coordinate multiple activities at the same time, including packing, transportation, cleaning, budgeting, appointments, household preparation, and service-provider selection.

The problem becomes more difficult when users must compare providers based on several factors at once. The lowest-priced provider may not offer the required quality, while the highest-rated provider may exceed the user's budget. Without a structured comparison experience, users often make decisions based on incomplete information or spend significant time comparing options manually.

4. Product Goals

- Simplify the end-to-end home-moving journey.
- Give users one place to organize moving tasks, packing, expenses, and key dates.
- Improve visibility into progress and remaining work.
- Make service-provider comparison clearer and faster.
- Help users identify options that match their preferred balance of price, quality, rating, and speed.
- Reduce the risk of missed tasks and unplanned moving expenses.
- Deliver a modern Arabic-first digital experience suitable for users in Saudi Arabia.

5. Target Users

- Individuals moving between rented homes.
- Families relocating to a new apartment or villa.
- Homeowners moving into a newly purchased residence.
- Users coordinating furniture moving, packing, cleaning, storage, or related services.
- Users who want to compare service providers without manually evaluating multiple options.

6. Value Proposition

Core value: Organize the move and make better service decisions from one place.

NAQL is not a moving company and does not replace service providers. It acts as the user's moving-management layer: organizing the journey, presenting relevant service options, and helping the user understand which option is most suitable.

7. Product Experience

Stage	Experience
1. Understand	The landing experience explains how NAQL supports the moving journey.
2. Plan	The user enters basic move information such as date, city, home type, rooms, and required services.
3. Organize	The user manages tasks, packing progress, and moving expenses.
4. Explore	The user browses relevant moving-related services and filters providers.
5. Compare	The NAQL Smart Advisor compares suitable providers using the user's priorities.
6. Decide	The user receives a clear recommendation with price, quality, and trade-off context.

8. Information Architecture

- Product introduction and moving journey overview.
- Personalized moving dashboard.
- Moving task management.
- Packing progress by room.
- Moving budget and expense tracking.
- Service discovery, filtering, and comparison.
- Practical moving guidance.
- AI-powered service recommendation.

9. Main Features

Feature	Description
Moving Dashboard	A clear overview of days remaining, overall progress, tasks, budget, packing status, and upcoming actions.
Task Management	Create, edit, complete, prioritize, and remove moving tasks.
Packing Tracker	Track packing progress by room and individual items.
Budget Planner	Set a moving budget, record expenses, and monitor remaining balance.
Service Directory	Browse providers across furniture moving, cleaning, packing, storage, and supporting services.
Service Filters	Filter options by category, city, price range, rating, and other useful attributes.
NAQL Smart Advisor	Compare relevant providers using the user's preferred balance of price, quality, rating, speed, and budget.
Moving Guide	Practical content covering preparation, moving day, packing, budgeting, and settling into the new home.

10. AI Feature NAQL Smart Advisor

The NAQL Smart Advisor is a decision-support feature designed to help users select suitable moving-related service providers. It does not replace the main product experience and is not presented as a generic chatbot.

Primary purpose: Recommend the most suitable service option based on user priorities and available provider information.

Primary interaction: The user selects the required service, preferred priority, city, and optional maximum budget.

10.1 Supported Service Categories

- Furniture moving
- Home cleaning
- Packing
- Storage
- Supporting moving services

10.2 User Priorities

- Lowest price
- Highest quality
- Best balance between price and quality
- Highest rating
- Fastest service

10.3 AI Recommendation Output

- Cheapest suitable option.
- Highest-quality option.
- Best overall value.
- Recommended option for the user's selected priority.
- Short explanation of why the provider was recommended.
- Key trade-offs the user should consider.

10.4 AI Data Principle

AI recommendations must be grounded in provider data available to NAQL. The system must not invent provider names, prices, ratings, availability, or service claims. The initial product version may operate on a curated provider dataset, while later releases can integrate verified provider feeds, live pricing, availability, ratings, and booking APIs.

11. Functional Requirements

ID	Requirement
FR-01	Users can start a moving journey without creating an account in the initial MVP.
FR-02	Users can enter basic move details including date, city, property type, room count, and required services.
FR-03	The dashboard shows progress, days remaining, tasks, budget, and packing status.
FR-04	Users can create, edit, complete, prioritize, and delete moving tasks.
FR-05	Users can manage packing items by room and see progress update automatically.
FR-06	Users can set a budget, add expenses, remove expenses, and see calculated totals.
FR-07	Users can browse and filter service providers.
FR-08	Users can open the Smart Advisor from the service-discovery experience.

FR-09	The Smart Advisor receives the user's priorities and relevant provider data.
FR-10	AI output is validated before being displayed.
FR-11	Comparison results are presented as structured recommendations rather than raw AI text or JSON.
FR-12	The platform gracefully handles unavailable AI responses or provider matches.
FR-13	Primary navigation and main calls to action remain functional across desktop and mobile.

12. Non-Functional Requirements

- Arabic-first experience with complete RTL support.
- Responsive design for desktop, tablet, and mobile.
- Fast and clear interactions with minimal unnecessary steps.
- High visual consistency and accessible contrast.
- Keyboard-accessible interactive controls.
- Clear form labels, validation, and user-friendly error messages.
- Secure server-side handling of AI credentials.
- Graceful degradation if the AI service is temporarily unavailable.
- Maintainable architecture that can evolve into a production platform.

13. Visual & UX Direction

NAQL should feel like a high-quality Saudi digital service: trustworthy, calm, modern, and clear. The interface should prioritize information hierarchy over decoration.

- Arabic-first typography and strong RTL composition.
- White and warm off-white foundations with deep Saudi-inspired green accents.
- Dark charcoal text and restrained semantic colors.
- Subtle borders and limited shadows.
- Generous whitespace and clear section rhythm.
- Professional line icons and simple moving/home visual elements.
- No clutter, excessive gradients, glassmorphism, or generic startup visuals.
- No random stock photography or fake user-profile imagery.

14. Security & Trust Requirements

- API keys and secrets must remain server-side.
- Secrets must be stored in environment variables.
- User input must be validated before it reaches external AI services.
- AI output must be validated before rendering.
- Unsafe HTML must not be rendered.
- Sensitive configuration must never be exposed through logs or client-side code.

- The product must clearly distinguish verified provider data from unverified or estimated information.
- AI recommendations should be explainable and based on available data rather than unsupported claims.

15. Success Metrics

Metric	Definition
Journey activation	Percentage of visitors who start a moving journey.
Task completion	Percentage of planned moving tasks completed before move date.
Service comparison usage	Percentage of service-directory users who use the Smart Advisor.
Recommendation engagement	Percentage of comparison sessions where a user opens or selects a recommended provider.
Budget visibility	Percentage of active journeys with a defined moving budget.
User efficiency	Reduction in time required to compare service options.
User confidence	Post-comparison rating of how confident users feel about their service choice.

16. MVP Scope

The MVP focuses on proving the core moving-management and service-comparison experience with a lightweight implementation. The product should demonstrate a coherent end-to-end journey without introducing operational complexity that is not required to validate the concept.

- Moving setup and dashboard.
- Task management.
- Packing tracker.
- Budget planner.
- Service-provider browsing and filtering.
- Curated provider dataset.
- AI-powered provider comparison and recommendation.
- Moving guide.
- Responsive Arabic RTL interface.

17. Product Limitations in the Initial Release

- No real-time provider availability unless a provider integration is connected.
- No live booking or payment flow in the initial release.
- No verified live market pricing unless connected through external provider APIs.
- The AI can only recommend based on provider information available to the platform.
- User accounts and persistent journey history may be introduced in a later release.

18. Future Roadmap

- Verified service-provider onboarding.
- Live pricing and availability integrations.
- Direct booking and payment.
- Verified customer ratings and reviews.
- User accounts and persistent moving journeys.
- Notifications and reminders.
- Location-aware provider recommendations.
- Personalized recommendations based on household profile and historical preferences.
- Provider dashboards and service management.
- Integration with home utilities and other move-related services.

19. Product Positioning

NAQL is positioned as a moving-management and decision-support platform rather than a directory or a moving company. Its differentiation comes from combining journey organization with intelligent service comparison in a single Arabic-first experience.
